We carry out three tests to evaluate the model performance. The first is the standard classification accuracy, which is the ratio of the number of classified objects to the number of total test images. In the second and the third tests, we conduct the parameter sensitivity analysis and the ablation study. In the parameter sensitivity analysis, we evaluate the performance of the model in different noise levels of images, and in the ablation study, we conduct a series of experiments to investigate the effectiveness of each component of the model in detail. Parameter sensitivity analysis ----- We conduct a series of experiments to evaluate the model in different noise levels of images. The noise levels include 20%, 30%, 40%, 50%, 60%, 70%, and 80%. The results are shown in Table \[tab:noise\]. \[lclclclclclcl\]{} & \& ----- standard accuracy : The standard classification accuracy of the model in different noise levels \[data-label="tab:noise"\] parameter sensitivity ----- ablation study(\%) \ ----- 68.35% +2.48% -0.13% +0.02% +0.23% 82157476af
